

Cell Production

"Increased productivity, error elimination, learning speed"

Cell production with **pick-to-light** optimizes the assembly process of subassemblies.

In "**Cell Production**" each operator works in a workstation or work cell. The Pick to Light devices linked to each component indicate to the operator the exact parts to pick up and assemble at every step. Side-by-side a screen can show the operator the sequential assembly tasks.

MEDIA

As it is a **guided work system**, it enables assembly process errors to be eliminated, increased productivity and the operator's learning curve to be significantly reduced.

Finished sub-assemblies are loaded onto racks or carts and delivered to the line-side to be incorporated in the end product.

BENEFITS

i

Our systems help to improve quality and cut delivery times.

ii

They reduce tension in the components supply chain and allow successful adaptation to personalised production and delivery deadlines.

iii

Flexibility and ease-of-use are key in our technology.
